Question:

Assignment on temperature and humidity sensing and alarm automation using python

Solution:

```
import random
temp=random.uniform(0,50)
#by using random.uniform function a random float value will be generated for
temp for
#example:25.718184973594976
print("TEMPERATURE:",temp)
temp=round(temp, 2)
#by using round of function the decimal points in the temp will be reduced for
example:25.7
print("TEMPERATURE:",temp)
#by using if condtion & elif condition the temp level is observed
if(temp<=0):
print("very cold")
elif(temp<=20):
print("cold")
elif(temp<=30):
print("Room temp")
elif(temp<=45):
```

```
print("hot")
else:
print("very hot alarm will be on")
humidity=random.randint(0,100)
#by using random.randint function a random int value will be generated for
humidity for example:55
print ("HUMIDITY:",humidity)
#by using if condtion & elif condition the humidity level is observed
if(humidity==0):
print("no humidity")
elif(humidity<=50):
print("humidity is low")
else:
print("humidity is high alarm will be on")
OUTPUT:
TEMPERATURE: 5.14227964069941
TEMPERATURE: 5.14
cold
HUMIDITY: 75
```

humidity is high alarm will be on
